

U M B R A

Trade size without showing your hand.

A private batch auction for tokenized bonds, settled on Canton.

SEALED BIDS · ONE FAIR PRICE · ATOMIC DVP

The order book is the leak.

A desk that wants to move a large position has nowhere to hide. The public book shows the intent, the market moves against it, and the cost lands in the fill. For decades, size and privacy have pulled in opposite directions. You trade small and slow, or you trade big and pay to be seen.

One window. One price. No leaks.

Desks submit sealed orders for a tokenized bond during a short window.

Nobody sees anyone else's order. When the window closes, an AI solver finds the single price that matches the most volume, and the whole batch settles in one transaction. Each desk learns only its own fill.

Bid, clear, settle.

01 Bid blind

Three desks submit into one batch. Each sees its own ticket and none of its rivals.

02 Clear once

The solver computes one uniform price for everyone. A separate calculation and the ledger itself confirm it before anything moves.

03 Settle as one

Bond and cash change hands in a single Canton transaction. All of it, or none of it.

Three things a public market cannot give you.

■ Privacy that holds at the wire

Each desk speaks to the ledger as itself, so the ledger will not hand it a rival's order. Put each desk on its own node and the orders are never even stored in the same place.

■ An AI you do not have to trust

The model proposes the price and writes the reasoning. A plain algorithm and the contract on the ledger both recompute it. The trade settles only when all three agree.

■ Settlement with no gap

Two legs, one transaction. There is never a moment where one side has paid and the other has not delivered.

WHAT A RIVAL SEES

BLUEROCK YOU BUY 10 at 101

MERIDIAN [REDACTED]

HALWARD [REDACTED]

REDACTED AT THE LEDGER

Canton is the **unlock**.

- **Privacy is the default, not a feature**

Canton shows each party only the parts of a deal they belong to. The guarantee comes from the network, not from a promise in our code.

- **One transaction moves everything**

The bond and the cash settle together, with finality. No clearing house in the middle, no waiting for the next day.

- **The assets are real and the books are already true**

When the batch clears on the ledger, settlement has happened. There is nothing left to reconcile.

One batch, cleared.

UNIFORM CLEARING PRICE

\$100.00

Matched 10 at 100.00

DESK	BOND X	USDC X
BLUEROCK	0 → 10	5000 → 4000
MERIDIAN	20 → 12	1000 → 1800
HALWARD	15 → 13	1000 → 1200

Every desk saw only its own fill. The batch settled in one Canton transaction, all of it at once.

One bond today. The whole desk next.

- **Real desks, real nodes**

Each institution runs on its own Canton participant. This build already proves it, with orders that never share a database.

- **Any tokenized asset**

The same sealed auction clears more than one bond. Point it at any instrument and the same privacy and atomic settlement come with it.

- **Custody institutions accept**

Swap the demo asset for Daml Finance holdings and the venue speaks the language real desks already settle in.

**Sealed bids. One fair price.
Settled in full, on Canton.**
